

Studio Now

On December, I plan to work on external works and the Forgetting series.

The explanation of my works

<Cognition – 8 Homogeniety & Inhomogeniety, 2020>

<Cognition – 8 Homogeniety & Inhomogeniety, 2020> is motivated by an image which expressed the stars of the universe. The mysterious lights of image in the piece represents stars like the sun, which is an assembly within the macro world that humans would never be able to visit, yet definitely exists. There are many stars that have the similar system to the solar system. On the other hand, there is also an assembly of atoms in the micro world, which humans can't cognize, yet exists. Both world undergo certain phenomena through light, and this is how humans can recognize their existence. This piece expresses my thoughts on how the similarities and differences of these two worlds are related to the existence of human beings, and I seek to work on the similar topic in the future as well.

Kim's Essay

Cause and Effect

A few that I know would sometimes say that they regret what they did in the past and if they had known there would be bad consequences, they would not have made such decision. I, too, have some regrets from the past. And if I could go back to those times, I probably would choose the 'direction' away from the decision made before. And the reason to why I chose to use the word 'direction' is because from a 'certain time of decision' until the time when the result comes out, 'the flow and direction of time and space' can change every time. Like I mentioned in my last essay, if human beings know the cause and effect, what changes would be brought to this world? Would the human beings in the present be in existence? There seem to have a be one precondition. That is, the knowledge levels of the ancient people are the same as those of present and the cause and effect they cognize include the present and the future.

If the ancient people knew the cause and effect, I could imagine a few things. First, there would not have been tragic wars. The weak would know the result before it even begins, so they would surrender in prior or handle the matter differently, so, no war. Second, there would be no countries or it would have been had to form a large scale human society. That is, knowing the cause and the effect can also mean in human society as since everyone's thoughts are different, nothing can have a beginning. Third, what about in the field of science? Humans have gone through many experiments and failures, and out of those failures were some accidental discoveries that formed the science today. But would the science at that time have began the experiment if they were sure to fail? If not, there would be no 'accidental discoveries.' Fourth, if the ancient people knew about the results of the human society in the present and the earth's environment, would the human society be in existence in present form?

I have this thought. If humans know all the cause and effect, wouldn't we also find out about why humans exist? Knowing the cause and effect is breaking down the 'incompleteness of human beings' which perhaps makes us human and making the questions about 'the reason for human existence' philosophers in the past would ask useless.
